THE DIKAIOSUNE MEGA PROJECT · VERSION 1

An integrated farm and a *veterinary university* on one living campus

We are planning a closed-loop farm where every animal, crop and by-product feeds the next, and where students learn on a working commercial farm every day.

Explore the farm | The university

~112 acres
Ccontiguous site, Barabanki

1 loop
Feed, animals, energy, soil, crops

10 labs
Specialised research and teaching labs

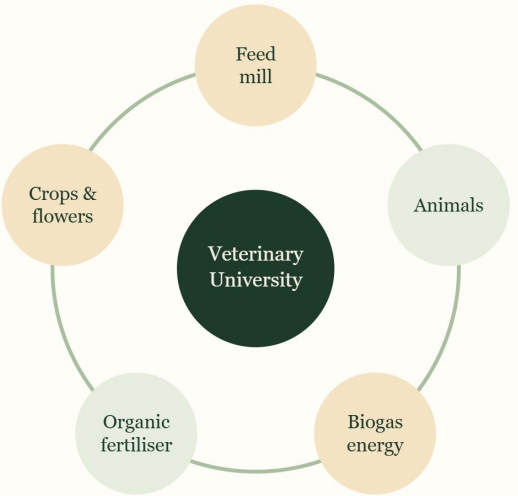

3 pillars
Feed, pigs and eggs at the core

THE VISION

Nothing leaves the farm as waste

The project is designed as one system. Our own feed mill supplies the animals; their manure becomes energy and fertiliser; the fertiliser grows the crops and flowers that close the circle.

1. **Our own feed mill**
   Balanced, tested feed made on site from local maize, soya and bran, for our animals and for farmers across the region.
2. **Animals raised with care**
   Pigs, poultry, Gir cattle, goats and fish in modern, automated, welfare-first housing.
3. **Manure into energy**
   A biogas plant turns manure into clean gas for the site and compressed biogas for sale.
4. **Digestate into soil**
   The leftover slurry is separated into organic fertiliser and recycled water.

5

Crops, fodder and flowers

Fertiliser and water return to fodder fields, flower gardens and bee pastures, and the cycle begins again.

THE INTEGRATED FARM

Version 1: every unit on one site

Three commercial pillars carry the farm. Around them, smaller units serve research, teaching and the loop itself. Figures shown are first-version planning targets, not current output.

CORE BUSINESS

Feed manufacturing

Branded feed and mineral mixture

An automated, lab-controlled feed mill for pigs, poultry and cattle, supplying our own farm first and then dealers and farmers across India.

CORE BUSINESS

Pig farm

Target: 500 pigs a month

Breeding, nursery and finishing houses with high-health genetics, an on-site semen station and strict biosecurity. Builds on our existing pig farm in Lucknow.

CORE BUSINESS

Layer eggs

Automated, graded, traceable

Climate-controlled layer houses with automatic feeding, collection and egg grading, packed for retail and institutional buyers.

FARM UNIT

Broiler poultry

Target: 2,500 birds a week

Tunnel-ventilated broiler houses that also serve as a teaching unit for poultry science students.

FARM UNIT

Gir cow dairy & ghee

Target: 5,000 L milk a day

An indigenous Gir herd with a ghee room built to export standard, and a teaching base for dairy science.

FARM UNIT

Fish (RAS)

Target: 10,000 fish a month

Recirculating aquaculture tanks that reuse water and give students hands-on fisheries training.

RESEARCH UNIT

Goats

Target: 100 goats a month

A small-ruminant unit for breeding studies, nutrition trials and farmer demonstrations.

RESEARCH UNIT

Bees & flowers

50 colonies · ~20% of land in bloom

Flower gardens fed by our own organic fertiliser, with apiaries for honey, pollination and research.

LOOP UNIT

Biogas & organic fertiliser

Manure in, energy and soil out

Compressed biogas for sale and site use, plus certified organic fertiliser for our fields and for farmers.

Planning targets are indicative for the first version and will be confirmed through detailed design, licensing and phased commissioning.

THE UNIVERSITY

A veterinary university that learns on a working farm

A private university under the Uttar Pradesh Private Universities Act, with a veterinary college at its core. The commercial farm is its teaching farm: students train on real herds, real feed batches and real business decisions. Programmes are subject to approval by the Veterinary Council of India and the state.

UNDERGRADUATE

BVSc & AH

The five-and-a-half-year veterinary degree, with clinical rotations in our teaching hospital and on the farm units.

POSTGRADUATE

MVSc & PhD

Research degrees in animal nutrition, genetics, reproduction, pathology and public health, built on our specialised labs.

PROFESSIONAL

Agribusiness & marketing

Programmes in livestock business, feed and food marketing, export and supply chains, taught alongside the farm's own operations.

SKILLS SCHOOL

Farmer & technician courses

Short courses in animal husbandry, AI technique, feed handling and biosecurity for farmers, entrepreneurs and farm staff.

Ten specialised labs

Each lab teaches students and serves the farm at the same time.

01 **Feed & Nutrition Analysis**
Quality control of every feed batch, and testing for outside customers.

02 **Animal Disease Diagnostics (BSL-2)**
Surveillance for swine fever, bird flu and PRRS; necropsy.

03 **Reproduction & AI**
Pig semen station and cattle artificial insemination.

04 **Teaching Veterinary Clinical Complex**
A hospital for livestock and pets, with imaging, theatres and ICU.

05 **Animal Genetics & Breeding**
Herd records and genomic selection for pigs and the Gir herd.

06 **Food Safety & Product QC**
Ghee purity, egg quality and microbiology.

07 **Microbiology & Biotech**
Bio-fertiliser cultures, mushroom spawn and probiotics.

08 **Soil, Water & Environment**
Soil and water testing, effluent and biogas monitoring.

09 **Precision Livestock & AI**
Sensors, cameras, farm software and data science across every unit.

10 **Pre-clinical Teaching Labs**
Anatomy, physiology, pathology, pharmacology and microbiology.

Earn while you learn
Students work part-time shifts across the farm units as part of their training.

Automation-first
Sensors and AI handle routine work, so people focus on animal care, science and decisions.

Open to farmers
Paid soil, feed and disease testing gives local farmers access to the same labs.

RESEARCH

Our research areas, brought to life

The research areas on our website each get a working home on the campus, linked to a farm unit and a lab, so findings move quickly from the lab to the field.

Animal nutrition
Feed formulation, local ingredients and feed efficiency trials.

Animal health
Disease surveillance, vaccination and biosecurity practice.

Breeding & genetics
Pig genetics and the improvement of indigenous Gir cattle.

Dairy science
A2 Gir milk, traditional ghee and quality testing.

Poultry science
Layer and broiler welfare, housing and egg quality.

Aquaculture
Recirculating systems and water reuse.

Small ruminants
Goat breeding and nutrition for smallholders.

Apiculture & floriculture
Pollination, honey and flowers on organic soil.

Renewable energy
Biogas from manure and its use on the farm.

Soil & organic inputs
Organic fertiliser, bio-cultures and soil health.

Precision farming
Sensors, automation and AI for livestock.

MASTER PLAN

How the ~112 acres are laid out

Zones are arranged by biosecurity and wind direction: the university and visitors at the entrance, clean feed production upwind, animal units in separated clusters, and the biogas plant downwind.

- **University campus** — Entrance
  Academic blocks, teaching hospital, hostels, at the public entrance
- **Feed mill & warehouse** — Upwind
  Clean zone with its own truck gate
- **Pig cluster** — Isolated
  Breeding, nursery, finishing; shower-in biosecurity
- **Poultry** — Isolated
  Layer and broiler houses, egg grading
- **Gir dairy & ghee room** — Central
  Herd, milking parlour, export-standard ghee room
- **Research units & labs** — Near campus
  Goats, fish tanks, apiary, specialised labs
- **Biogas & fertiliser** — Downwind
  Digester, gas upgrading, separator
- **Green belt & fields** — Perimeter
  Fodder, flower gardens, bee pasture, tree buffer

BUILT RESPONSIBLY

Welfare, safety and the land come first

Animal welfare

Space, climate control, enrichment and humane handling, in keeping with our belief in justice for every living soul.

Biosecurity

Separated units, shower-in entry, controlled traffic and an on-site diagnostics lab.

Clean energy

Manure becomes biogas instead of a pollution problem, cutting emissions and odour.

Water reuse

Recycled water from the separator and fish tanks irrigates fodder and flowers.

Export-grade quality

The feed mill, ghee room and key labs are built to export and accreditation standards from day one.

Local livelihoods

Skilled jobs, student work, training for farmers and a reliable buyer and supplier for the region.

ROADMAP

From land to campus

An indicative sequence. Dates will be confirmed as approvals and construction progress.

STAGE 1

Land & approvals

Secure the site, land-use change, environmental and pollution clearances.

STAGE 2

Feed mill & utilities

Roads, power, water, the feed mill and the first labs.

STAGE 3

Animal units

Pig cluster, poultry, dairy and the biogas plant come online in phases.

STAGE 4

University

University establishment under state law; veterinary college approval.

STAGE 5

Scale & export

Feed sales across India, accredited labs and export-ready products.

Justice for every living soul.

Dikaiosune began as a family-run farm sanctuary. The mega project carries the same idea to a larger scale: a farm that is productive, humane and a place of learning.

Build this with us

We welcome conversations with academic partners, technology and equipment suppliers, feed and food buyers, and organisations who share our values.
